

Connect to BSD VPN

BSD VPN is a Windows VPN Profile. BSD VPN is automatically deployed to user accounts on district computers running Windows 10 1909. BSD VPN can also be manually installed from Software Center when on a district computer running any version of Windows 10.

You need BSD VPN if you intend to access certain district resources offsite ([Resources Requiring Onsite or BSD VPN Connection](#)).

Verify you have BSD VPN installed

BSD VPN is deployed to user accounts. After you log onto a computer for the first time, BSD VPN will soon automatically appear in your network connections.

1. Click the network icon in you taskbar

2. Check if BSD VPN is the list of network connections

3. If BSD VPN is not in your list of network connections automatically before you need to take your laptop offsite, it is recommended that you manually install it from Software Center ([How To Use the Software Center](#)) before leaving. If you don't see BSD VPN and you have more setup to do on your laptop before leaving, complete your other setup first and then install BSD VPN if it still has not showed up automatically.

Connect to BSD VPN

To connect to BSD VPN, first connect to your wireless network connection like normal and then select BSD VPN.

Remember to disconnect from BSD VPN after you have what you need. Staying connected to BSD VPN when not needed will slow down your internet access and also unnecessarily use up network resources.
