

# Install Applications from Software Center

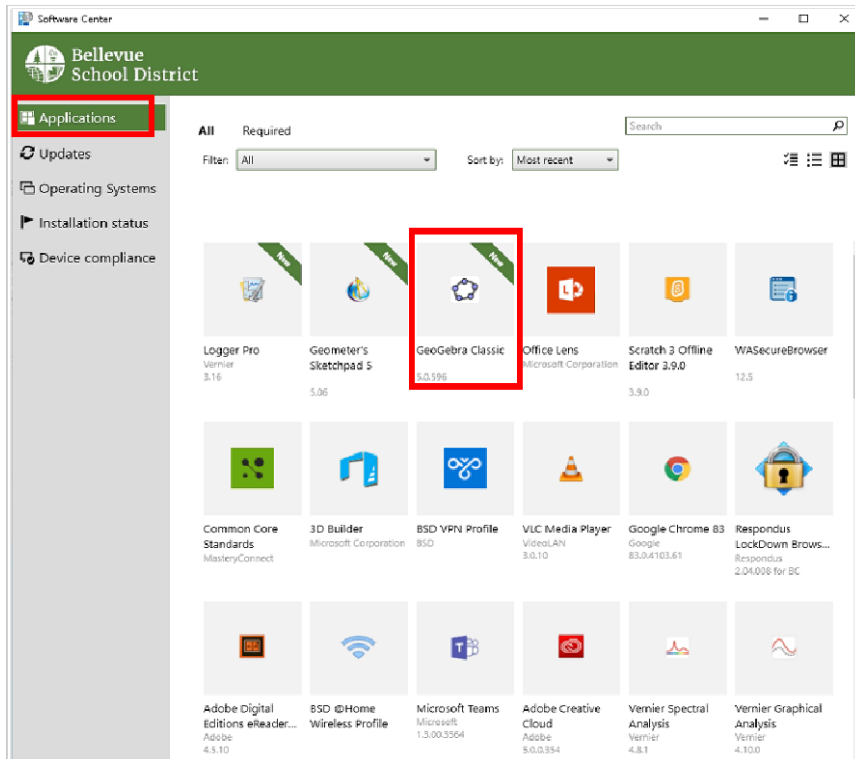

Software Center installations work both onsite and remotely over the Internet. A VPN connection is not required for Software Center access for computers that have been onsite since April 2020. However, if no applications show up in Software Center or just a few applications that you have already installed, you may be able to workaround the issue by connecting to VPN.

## How to use Software Center

1. Click the **Software Center** tile on the Start menu or search "software center" from the Start button.

2. Click the **Applications** side tab to show all applications available to you and select the application you want to install.

3. If you do not see any applications or just a few and they are applications you have already installed, try these steps:

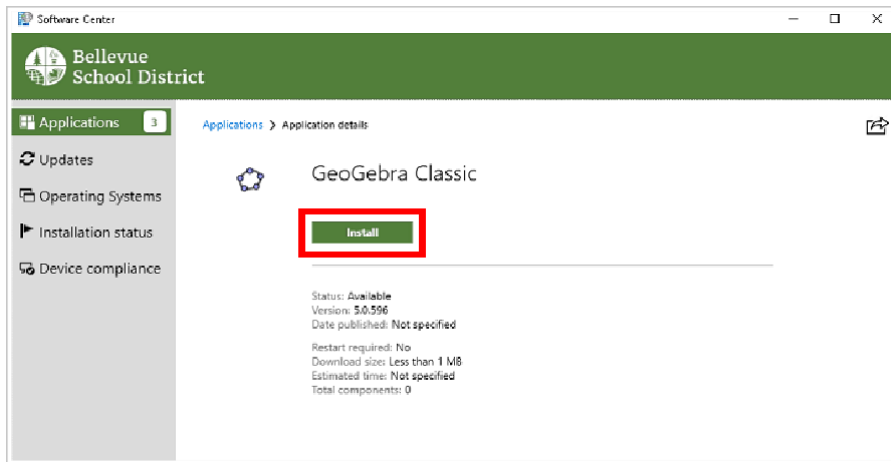

If you are at a school location:

- Restart your computer
- Give the computer time to load and then a few more minutes (SW Center needs time to make connections) Open Software Center.
- Open Software Center again. If you still don't see any applications, close Software Center, wait a few minutes, open Software Center again.

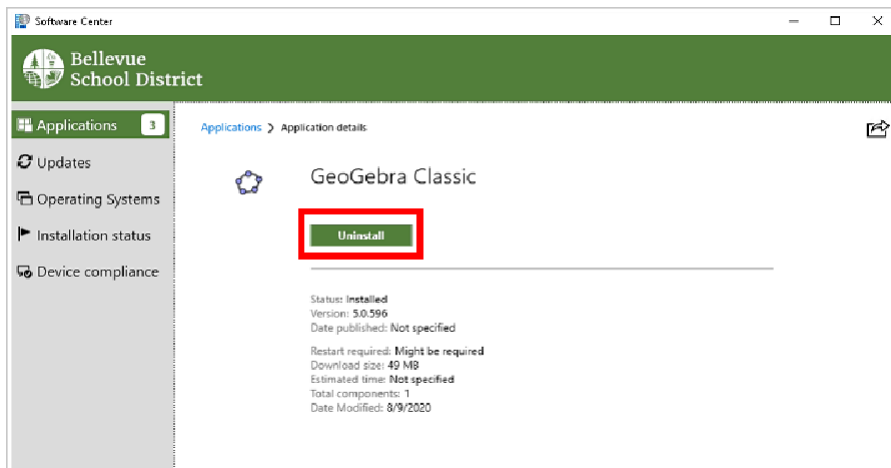

If you are remote:

- Close Software Center
- Connect to VPN (Connect to BSD VPN)
- Wait a few minutes
- Open Software Center again. If you still don't see any applications, close Software Center, wait a few minutes, open Software Center again.

4. Click **Install** to install the application.

5. To the **Uninstall** button to uninstall an application.

6. You can see applications you have installed by selecting the **Installation status** side tab.
